

The Municipality of Oreokastro completed a key project that improves the quality of life of the residents of the settlement of Anthoupolis of the Community of Liti, with the installation of a water treatment system in order to solve a chronic water quality problem.

The water of the area is now clean and safe, as the project "Aquality" was completed, in the context of which the installation of the de-ironing and de-humidification of the water took place.

"We provided a solution to the chronic and important water problem faced by the residents of Anthoupolis and we successfully completed the project."Residents now enjoy good quality water and good quality water means upgrading the living standards of residents," said Pantelis Tsakiris, mayor of Oreokastro.

The object of the contract was the supply, installation and commissioning of a water treatment system for the removal of hydrogen sulfide, iron and manganese ions from the water supply of the settlement of Anthoupolis in D.K. Looter of the Municipality of Oreokastro.

Drilling water is being collected in a raw water storage tank. The water from the tank is pumped through the filters of the water treatment system and, finally, treated water goes to the existing drinking water tank.

The chosen method for the removal of ions from the water is completely natural and has already been successfully applied in similar facilities in Greece.

The contractor of the project is the company "TEMAK AETE", which fulfilled all its contractual obligations in a timely and effective manner.
